## **HW01**

## HOJUNE LEE, 20210541

**Exercise 2.15.** Verify that  $\lambda^{-1}(-)$  and its  $\beta$ ,  $\eta$ -rules do infact imply our original elimination  $\beta$ ,  $\eta$ -rule.

*Proof.* Let's make clear understanding about this question first. First,  $\lambda^{-1}(-)$  is direct representation of forward isomorphism between  $Tm(\Gamma, \Pi(A, B)) \cong Tm(\Gamma, A, B)$ , which means

$$\iota_{\Gamma,A,B}: Tm(\Gamma,\Pi(A,B)) \xrightarrow{\cong} Tm(\Gamma.A,B)$$

which means that, it is a kind of homomorphism that for given  $f: \Pi(A, B)$ , construct term  $\lambda^{-1}(f)$  in context  $\Gamma.A$  which type is B. By the given rule, we write

$$\frac{\Gamma \vdash f : \Pi(A, B)}{\Gamma . A \vdash \lambda^{-1}(f) : B}$$

In this case, defining  $\beta$ ,  $\eta$ -rule is quite simple, each are

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma.A \vdash b : B}{\Gamma.A \vdash \lambda^{-1}(\lambda(b)) = b : B} \qquad \frac{\Gamma \vdash A \text{ type} \quad \Gamma.A \vdash B \text{ type} \quad \Gamma \vdash f : \Pi(A, B)}{\Gamma \vdash \lambda(\lambda^{-1}(f)) = f : \Pi(A, B)}$$

Here, if there exists a term a such that  $\Gamma \vdash a : A$ , then we can construct an substitution  $\Gamma \vdash \mathbf{id}.a : \Gamma.A$  and then we can pull-back above  $\lambda^{-1}(f)$  through  $\mathbf{id}.a$ . Then we can write,

$$\frac{\Gamma \vdash f : \Pi(A, B) \quad \Gamma \vdash a : A}{\Gamma \vdash \lambda^{-1}(f)[\mathbf{id}.a] : B[\mathbf{id}.a]}$$

The result term is what we defined originally as  $\mathbf{app}(f, a) := \lambda^{-1}(f)[\mathbf{id}.a]$ . So, the question is that can we derive our original  $\beta$ ,  $\eta$ -rules for  $\mathbf{app}(-, -)$  via above rules? Here, such original  $\beta$ ,  $\eta$ -rule is written by

$$\frac{\Gamma \vdash a : A \quad \Gamma.A \vdash b : B}{\Gamma \vdash \mathbf{app}(\lambda(b), a) = b[\mathbf{id}.a] : B[\mathbf{id}.a]} \qquad \frac{\Gamma \vdash A \text{ type} \quad \vdash \Gamma.A \vdash B \text{ type} \quad \Gamma \vdash f : \Pi(A, B)}{\Gamma \vdash \lambda(\mathbf{app}(f[\mathbf{p}], \mathbf{q})) = f : \Pi(A, B)}$$

Let's prove first one. Since we have  $\Gamma \vdash A$  type as pre-supposition, we get

$$\frac{\Gamma \vdash A \text{ type } \Gamma.A \vdash b : B}{\Gamma.A \vdash \lambda^{-1}(\lambda(b)) = b : B}$$

However, since  $\Gamma \vdash a : A$  is given, we can construct substitution

$$\Gamma \vdash \mathbf{id}.a : \Gamma.A$$

So we can pull-back the result into context  $\Gamma$ ,

$$\Gamma \vdash \lambda^{-1}(\lambda(b))[\mathbf{id}.a] = b[\mathbf{id}.a] : B[\mathbf{id}.a]$$

Recap the definition of  $\mathbf{app}(-,-)$ . We can rewrite above result by

$$\Gamma \vdash \mathbf{app}(\lambda(b), a) = b[\mathbf{id}.a] : B[\mathbf{id}.a]$$

This proved the first one. Let's prove second one. Before prove this, we must argue the naturality of forward homomorphism  $\iota_{\Gamma,A,B}$  in our version. Suppose that following diagram,

$$Tm(\Gamma,\Pi(A,B)) \xrightarrow{\iota_{\Gamma}} Tm(\Gamma.A,B)$$

$$\downarrow^{\gamma^{*}} \qquad \qquad \downarrow^{\gamma.A^{*}}$$

$$Tm(\Delta,\Pi(A[\gamma],B[\gamma.A])) \xrightarrow{\iota_{\Delta}} Tm(\Delta.A[\gamma],B[\gamma.A])$$

Here,  $\gamma^*$  and  $\gamma.A^*$  notate that works of pull-back operator w.r.t.  $\gamma$  and  $\gamma.A$ . And since we've construct such isomorphisms via  $\lambda^{-1}$ , to satisfy naturality of  $\iota$  here, following must holds:

$$\frac{\Delta \vdash \gamma : \Gamma \quad \Gamma \vdash A \text{ type} \quad \Gamma.A \vdash B \text{ type} \quad \Gamma \vdash f : \Pi(A, B)}{\Delta.A[\gamma] \vdash \lambda^{-1}(f[\gamma]) = \lambda^{-1}(f)[\gamma.A] : B[\gamma.A]}$$

This can be easily obtained via following application of above diagram.

$$\Gamma \vdash f : \Pi(A,B) \xrightarrow{\cong \text{ by } \lambda^{-1}} \Gamma.A \vdash \lambda^{-1}(f) : B$$

$$\downarrow^{\text{pull-back by } \gamma} \qquad \qquad \downarrow^{\text{pull-back by } \gamma.A}$$

$$\Delta \vdash f[\gamma] : \Pi(A[\gamma],B[\gamma.A]) \xrightarrow{\cong \text{ by } \lambda^{-1}} \Delta.A[\gamma] \vdash \lambda^{-1}(f[\gamma]) = \lambda^{-1}(f)[\gamma.A] : B[\gamma.A]$$

We can use above rule for proving second one by:

$$\frac{\Gamma.A \vdash \mathbf{p} : \Gamma \quad \Gamma \vdash A \text{ type} \quad \Gamma.A \vdash B \text{ type} \quad \Gamma \vdash f : \Pi(A, B)}{\Gamma.A.A[\mathbf{p}] \vdash \lambda^{-1}(f[\mathbf{p}]) = \lambda^{-1}(f)[\mathbf{p}.A] : B[\mathbf{p}.A]}$$

However, since there exists a term  $\Gamma.A \vdash \mathbf{q} : A[\mathbf{p}]$ , we can construct well-formed substitution  $\Gamma.A \vdash \mathbf{id.q} : \Gamma.A.A[\mathbf{p}]$ . Let's pull-back above result by  $\mathbf{id.q} :$ 

$$\Gamma.A \vdash \lambda^{-1}(f[\mathbf{p}])[\mathbf{id}.\mathbf{q}] = \lambda^{-1}(f)[\mathbf{p}.A][\mathbf{id}.\mathbf{q}] : B[\mathbf{p}.A][\mathbf{id}.\mathbf{q}]$$

However, we already know that  $(\mathbf{p}.A) \circ (\mathbf{id}.\mathbf{q}) = \mathbf{id}$ , rewrite above by :

$$\Gamma.A \vdash \lambda^{-1}(f[\mathbf{p}])[\mathbf{id.q}] = \lambda^{-1}(f) : B$$

Here, by introduction rule,

$$\Gamma \vdash \lambda(\lambda^{-1}(f[\mathbf{p}])[\mathbf{id}.\mathbf{q}]) = \lambda(\lambda^{-1}(f)) : \Pi(A, B)$$

Now almost done. Rewrite  $\lambda^{-1}(f[\mathbf{p}][\mathbf{id}.\mathbf{q}])$  as  $\mathbf{app}(f[\mathbf{p}],\mathbf{q})$  and rewrite  $\lambda(\lambda^{-1}(f))$  as f.

$$\Gamma \vdash \lambda(\mathbf{app}(f[\mathbf{p}], \mathbf{q})) = f : \Pi(A, B)$$

This is end of proof.  $\Box$ 

**Exercise 2.16.** Show that using  $\Sigma$  types we can define a non-dependent pair type whose formation rule states that if  $\Gamma \vdash A$  type and  $\Gamma \vdash B$  type then  $\Gamma \vdash A \times B$  type. Then define the introduction and elimination rules from section 2.1 for this encoding, and check that  $\beta$ ,  $\eta$ -rules holds.

*Proof.* Our goal is that construct following rules of non-dependent pair type can be defined via dependent sum type  $\Sigma$ .

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma \vdash B \text{ type}}{\Gamma \vdash A \times B \text{ type}} \qquad \frac{\Gamma \vdash a : A \quad \Gamma \vdash b : B}{\Gamma \vdash (a,b) : A \times B} \qquad \frac{\Gamma \vdash p : A \times B}{\Gamma \vdash \text{fst}(p) : A} \qquad \frac{\Gamma \vdash p : A \times B}{\Gamma \vdash \text{snd}(p) : B}$$

$$\frac{\Gamma \vdash a : A \quad \Gamma \vdash b : B}{\Gamma \vdash \text{fst}((a,b)) = a : A} \qquad \frac{\Gamma \vdash a : A \quad \Gamma \vdash b : B}{\Gamma \vdash \text{snd}((a,b)) = b : B} \qquad \frac{\Gamma \vdash p : A \times B}{\Gamma \vdash p : A \times B}$$

$$\frac{\Delta \vdash \gamma : \Gamma \quad \Gamma \vdash A, B \text{ type}}{\Delta \vdash (A \times B)[\gamma] = A[\gamma] \times B[\gamma] \text{ type}} \qquad \frac{\Delta \vdash \gamma : \Gamma \quad \Gamma \vdash a : A, b : B \quad \Gamma \vdash (a,b) : A \times B}{\Delta \vdash (a,b)[\gamma] = (a[\gamma], b[\gamma]) : A[\gamma] \times B[\gamma]}$$

First, let's define  $A \times B$  first. Since  $\Gamma \vdash A$  type implies that  $\Gamma.A \vdash B[\mathbf{p}]$  type, so we can define

$$A \times B := \Sigma(A, B[\mathbf{p}])$$

Then remainings can be shown easily. If  $\Gamma \vdash a : A$  and  $\Gamma \vdash b : B$ , then  $\Gamma \vdash b : B[\mathbf{id}] = B[\mathbf{p}][\mathbf{id}.a]$ , so

$$\frac{\Gamma \vdash a : A \quad \Gamma \vdash b : B}{\Gamma \vdash (a, b) := \mathbf{pair}(a, b) : \Sigma(A, B[\mathbf{p}])}$$

**fst**, **snd** can be defined by :

$$\frac{\Gamma \vdash p : \Sigma(A, B[\mathbf{p}])}{\Gamma \vdash \mathbf{fst}(p) : A \qquad \Gamma \vdash \mathbf{snd}(p) : B[\mathbf{p}][\mathbf{id}.\mathbf{fst}(p)] = B}$$

Then we can also see that such construction holds naturality.

$$\frac{\Delta \vdash \gamma : \Gamma \quad \Gamma \vdash A, B \text{ type}}{\Delta \vdash (A \times B)[\gamma] = \Sigma(A, B[\mathbf{p}])[\gamma] = \Sigma(A[\gamma], B[\mathbf{p}][\gamma.A]) = \Sigma(A[\gamma], B[\gamma][\mathbf{p}]) = A[\gamma] \times B[\gamma] \text{ type}}$$

$$\frac{\Delta \vdash \gamma : \Gamma \quad \Gamma \vdash a : A, b : B \quad \Gamma \vdash (a, b) : A \times B}{\Delta \vdash (a, b)[\gamma] = \mathbf{pair}(a, b)[\gamma] = \mathbf{pair}(a[\gamma], b[\gamma]) = (a[\gamma], b[\gamma]) : A[\gamma] \times B[\gamma]}$$

Here, the type-former works like

$$\underset{\Gamma}{\swarrow}: Ty(\Gamma) \times Ty(\Gamma) \to Ty(\Gamma)$$

And the term natural isomorphism is constructed via

$$\iota: Tm(\Gamma, A) \times Tm(\Gamma, B) \cong Tm(\Gamma, A \times B)$$

Remaining is that check for the  $\beta$ ,  $\eta$ -rules.

$$\begin{split} \frac{\Gamma \vdash a : A \quad \Gamma.A \vdash B[\mathbf{p}] \text{ type} \quad \Gamma \vdash b : B = B[\mathbf{p}][\mathbf{id}.a]}{\Gamma \vdash \mathbf{fst}((a,b)) = \mathbf{fst}(\mathbf{pair}(a,b)) = a : A} \\ \frac{\Gamma \vdash a : A \quad \Gamma.A \vdash B[\mathbf{p}] \text{ type} \quad \Gamma \vdash b : B = B[\mathbf{p}][\mathbf{id}.a]}{\Gamma \vdash \mathbf{snd}((a,b)) = \mathbf{snd}(\mathbf{pair}(a,b)) = b : B} \end{split}$$

Finally,

$$\frac{\Gamma \vdash A \text{ type} \quad \Gamma.A \vdash B[\mathbf{p}] \text{ type} \quad \Gamma \vdash p : A \times B = \Sigma(A, B[\mathbf{p}])}{\Gamma \vdash p = \mathbf{pair}(\mathbf{fst}(p), \mathbf{snd}(p)) = (\mathbf{fst}(p), \mathbf{snd}(p)) : A \times B}$$

So our definition  $A \times B := \Sigma(A, B[\mathbf{p}])$  holds on whole requirements.

**Exercise 2.24.** Fixing  $\Delta \vdash \gamma : \Gamma$ , prove that there is at most one substitution  $\Delta \vdash \overline{\gamma} : \Gamma$ . **Void** such that satisfying  $\mathbf{p} \circ \overline{\gamma} = \gamma$ .

*Proof.* I'll draw diagram for good understanding.

We'll use following rule for substitution:

(\*) 
$$\frac{\Gamma \vdash A \text{ type } \Delta \vdash \gamma : \Gamma.A}{\Delta \vdash \gamma = (\mathbf{p} \circ \gamma).\mathbf{q}[\gamma] : \Gamma.A}$$

Suppose that  $\overline{\gamma}_i$ , i=1,2 such that  $\Delta \vdash \overline{\gamma}_i$ :  $\Gamma$ .Void, i=1,2 and  $(\mathbf{p} \circ \overline{\gamma}_i) = \gamma$ , i=1,2 exists. Then we can apply (\*) by

$$\frac{\Gamma \vdash \mathbf{Void} \ \mathrm{type} \quad \Delta \vdash \overline{\gamma}_i : \Gamma.\mathbf{Void}}{\Delta \vdash \overline{\gamma}_i = (\mathbf{p} \circ \overline{\gamma}_i).\mathbf{q}[\overline{\gamma}_i] : \Gamma.\mathbf{Void}}$$

By assumption, we can directly rewrite above result by

$$\Delta \vdash \overline{\gamma}_i = \gamma.\mathbf{q}[\overline{\gamma}_i] : \Gamma.\mathbf{Void}$$

However,  $\Gamma$ .Void  $\vdash \mathbf{q}$ : Void. So, we can pull-back  $\mathbf{q}$  through  $\overline{\gamma}_i$ .

$$\frac{\Delta \vdash \overline{\gamma}_i : \Gamma.\mathbf{Void} \quad \Gamma.\mathbf{Void} \vdash \mathbf{q} : \mathbf{Void}}{\Delta \vdash \mathbf{q}[\overline{\gamma}_i] : \mathbf{Void}[\overline{\gamma}_i] = \mathbf{Void}}$$

However, the result of Exercise 2.23. implies that,

$$\Delta \vdash \mathbf{q}[\overline{\gamma}_1] = \mathbf{q}[\overline{\gamma}_2] : \mathbf{Void}$$

We can use this result for (\*\*).

$$\Delta \vdash \overline{\gamma}_1 = \gamma.\mathbf{q}[\overline{\gamma}_1] = \gamma.\mathbf{q}[\overline{\gamma}_2] = \overline{\gamma}_2 : \Gamma.\mathbf{Void}$$

This implies that,

$$\Delta \vdash \overline{\gamma}_1 = \overline{\gamma}_2 : \Gamma.\mathbf{Void}$$

We proved that, if such  $\overline{\gamma}$  exists, then it is unique. This is sufficient to prove that there is at most one such  $\overline{\gamma}$ .

**Exercise 2.25.** Let  $\Gamma$ .Void  $\vdash A$  type and  $\Gamma \vdash a : A[id.b]$ . Show that  $\Gamma$ .Void  $\vdash A[(id.b) \circ \mathbf{p}] = A$  type, and therefore that  $\Gamma$ .Void  $\vdash a[\mathbf{p}] : A$ .

*Proof.* We'll use following previous result.

$$(\gamma.a) \circ \delta = (\gamma \circ \delta).a[\delta]$$

In this exercies, we can write as

$$(\mathbf{id}.b) \circ \mathbf{p} = (\mathbf{id} \circ \mathbf{p}).b[\mathbf{p}]$$

However, by property of id,

(\*) 
$$(\mathbf{id}.b) \circ \mathbf{p} = (\mathbf{id} \circ \mathbf{p}).b[\mathbf{p}] = \mathbf{p}.b[\mathbf{p}]$$

However, our problem gives some pre-supposition:

$$\Gamma \vdash A[\mathbf{id}.b]$$
 type

Which means that

 $\Gamma \vdash \mathbf{id}.b : \Gamma.\mathbf{Void}$ 

This also gives pre-supposition:

 $\Gamma \vdash b : \mathbf{Void}$ 

So we can pull-back such b through  $\mathbf{p}$ :

$$\Gamma.$$
Void  $\vdash b[p] : Void[p] = Void$ 

However,  $\Gamma$ .Void  $\vdash$  **q** : Void and Exercise 2.23. implies that

$$\Gamma$$
.Void  $\vdash b[\mathbf{p}] = \mathbf{q} : Void$ 

Then we can rewrite (\*) by

$$(id.b) \circ \mathbf{p} = (id \circ \mathbf{p}).b[\mathbf{p}] = \mathbf{p}.b[\mathbf{p}] = \mathbf{p}.\mathbf{q} = id$$

in context  $\Gamma$ . Void. So we can prove our original claim,

$$\Gamma$$
.Void  $\vdash A[(id.b) \circ p] = A[id] = A$  type

Then the remaining part is easy. Since  $\Gamma \vdash a : A[\mathbf{id}.b]$ , we can pull-back a into  $\Gamma$ . **Void** through p :

$$\Gamma.\mathbf{Void} \vdash a[\mathbf{p}] : A[\mathbf{id}.b][\mathbf{p}] = A[(\mathbf{id}.b) \circ \mathbf{p}] = A$$

8 HOJUNE LEE

**Exercise 2.26.** Derive the following rule, using the previous exercise and the  $\eta$ -rule.

$$\frac{\Gamma \vdash b : \mathbf{Void} \quad \Gamma.\mathbf{Void} \vdash A \text{ type} \quad \Gamma \vdash a : A[\mathbf{id}.b]}{\Gamma \vdash a = \mathbf{absurd}(b) : A[\mathbf{id}.b]}$$

*Proof.* We'll use above Exercise 2.25. as lemma. We proved that

(\*) 
$$\frac{\Gamma \vdash b : \mathbf{Void} \quad \Gamma.\mathbf{Void} \vdash A \quad \text{type} \quad \Gamma \vdash a : A[\mathbf{id}.b]}{\Gamma.\mathbf{Void} \vdash a[\mathbf{p}] : A}$$

And the original  $\eta$ -rule is that

$$\frac{\Gamma \vdash b : \mathbf{Void} \quad \Gamma.\mathbf{Void} \vdash a : A}{\Gamma \vdash \mathbf{absurd}(b) = a[\mathbf{id}.b] : A[\mathbf{id}.b]}$$

To apply this, let's write that

$$\frac{\Gamma \vdash b : \mathbf{Void} \quad \Gamma.\mathbf{Void} \vdash a[\mathbf{p}] : A}{\Gamma \vdash \mathbf{absurd}(b) = a[\mathbf{p}][\mathbf{id}.b] : A[\mathbf{id}.b]}$$

Since (\*) gives the premises, we get

$$\Gamma \vdash \mathbf{absurd}(b) = a[\mathbf{p}][\mathbf{id}.b] : A[\mathbf{id}.b]$$

However, 
$$a[\mathbf{p}][\mathbf{id}.b] = a[\mathbf{p} \circ (\mathbf{id}.b)] = a[\mathbf{id}] = a$$
, we can get

$$\Gamma \vdash \mathbf{absurd}(b) = a : A[\mathbf{id}.b]$$

This is End of Proof.

**Exercise 2.29.** Give rules axiomatizing the boolean analogue of **absurd**', and prove that these rules are interderivable with our rules for  $\mathbf{if}(a_t, a_f, b)$ .

*Proof.* This is also question about 'cut-rule applied' version of our backward homomorphism  $\iota^{-1}$ . Since

$$\iota^{-1}: Tm(\Gamma, A[\mathbf{id.true}]) \times Tm(\Gamma, A[\mathbf{id.false}]) \to Tm(\Gamma.\mathbf{Bool}, A)$$

Then when we directly construct this homomorphism, it will be

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type } \Gamma \vdash a_t : A[\mathbf{id.true}] \quad \Gamma \vdash a_f : A[\mathbf{id.false}]}{\Gamma.\mathbf{Bool} \vdash \mathbf{if}'(a_t, a_f) : A}$$

With above definition, the remaining modified rules are simply constructed:

$$\frac{\Delta \vdash \gamma : \Gamma \quad \Gamma.\mathbf{Bool} : A \text{ type} \quad \Gamma \vdash a_t : A[\mathbf{id.true}] \quad \Gamma \vdash a_f : A[\mathbf{id.false}]}{\Delta.\mathbf{Bool} \vdash \mathbf{if}'(a_t, a_f)[\gamma.\mathbf{Bool}] = \mathbf{if}'(a_t[\gamma], a_f[\gamma]) : A[\gamma.\mathbf{Bool}]}$$

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type } \Gamma \vdash a_t : A[\mathbf{id.true}] \quad \Gamma \vdash a_f : A[\mathbf{id.false}]}{\Gamma \vdash \mathbf{if}'(a_t, a_f)[\mathbf{id.true}] = a_t : A[\mathbf{id.true}]}$$

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type} \quad \Gamma \vdash a_t : A[\mathbf{id.true}] \quad \Gamma \vdash a_f : A[\mathbf{id.false}]}{\Gamma \vdash \mathbf{if}'(a_t, a_f)[\mathbf{id.false}] = a_f : A[\mathbf{id.false}]}$$

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type} \quad \Gamma.\mathbf{Bool} \vdash a : A}{\Gamma.\mathbf{Bool} \vdash \mathbf{if}'(a[\mathbf{id.true}], a[\mathbf{id.false}]) = a : A}$$

However, our rules for **if** is constructed on context  $\Gamma$ . Actually, as same we discussed, it can be imagined as pull-backed **if**' into  $\Gamma$ . Here, we can write

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type } \Gamma \vdash a_t : A[\mathbf{id}.\mathbf{true}] \quad \Gamma \vdash a_f : A[\mathbf{id}.\mathbf{false}] \quad \Gamma \vdash b : \mathbf{Bool}}{\Gamma \vdash \mathbf{if}'(a_t, a_f)[\mathbf{id}.b] := \mathbf{if}(a_t, a_f, b) : A[\mathbf{id}.b]}$$

Now, let's prove our original rules for **if** implies above  $\beta$ ,  $\eta$ -rules. ( Here, I'll omit some premises when they are clear ) We have

$$\Gamma \vdash \mathbf{if}(a_t, a_f, \mathbf{true}) = a_t : A[\mathbf{id}.\mathbf{true}]$$

Rewrite this:

$$\Gamma \vdash \mathbf{if}'(a_t, a_f)[\mathbf{id.true}] = a_t : A[\mathbf{id.true}]$$

Similarly,

$$\Gamma \vdash \mathbf{if}'(a_t, a_f)[\mathbf{id}.\mathbf{false}] = a_f : A[\mathbf{id}.\mathbf{false}]$$

This directly proves above  $\beta$ -rules. For  $\eta$ -rule, we can imagine following diagram:

10 HOJUNE LEE

$$\Gamma \xleftarrow{p} \Gamma.\mathbf{Bool} \xrightarrow[p.\mathbf{Bool}]{id.q} \Gamma.\mathbf{Bool}.\mathbf{Bool}$$

How can we use above intuition? Let's see. The original  $\eta$ -rule was

$$\frac{\Gamma.\mathbf{Bool} \vdash A \text{ type} \quad \Gamma.\mathbf{Bool} \vdash a : A \quad \Gamma \vdash b : \mathbf{Bool}}{\Gamma \vdash \mathbf{if}(a[\mathbf{id.true}], a[\mathbf{id.false}], b) = a[\mathbf{id}.b] : A[\mathbf{id}.b]}$$

We'll apply this rule by following pattern:

$$\frac{\Gamma.\mathbf{Bool.Bool} \vdash A[\mathbf{p.Bool}] \ \mathrm{type} \quad \Gamma.\mathbf{Bool.Bool} \vdash a[\mathbf{p.Bool}] : A[\mathbf{p.Bool}] \quad \Gamma.\mathbf{Bool} \vdash \mathbf{q} : \mathbf{Bool}}{\Gamma.\mathbf{Bool} \vdash \mathbf{if}(a[\mathbf{p.Bool}][\mathbf{id.true}], a[\mathbf{p.Bool}][\mathbf{id.false}], \mathbf{q}) = a[\mathbf{p.Bool}][\mathbf{id.q}] : A[\mathbf{p.Bool}][\mathbf{id.q}]}$$

We can rewrite using  $\mathbf{p}.\mathbf{Bool} \circ \mathbf{id}.\mathbf{q} = \mathbf{id}$ , the result of above as :

$$\Gamma.$$
Bool  $\vdash if(a[p.Bool][id.true], a[p.Bool][id.false], q) = a : A$ 

However, this is

$$\Gamma.\mathbf{Bool} \vdash \mathbf{if}'(a[\mathbf{id}.\mathbf{true}], a[\mathbf{id}.\mathbf{false}]) = a : A$$

This is End of Proof.

.
